

COMPANION CARE

The intelligence layer for dementia care.

An adaptive AI companion for early-to-mid stage dementia — **built for the patient, the caregiver, and the doctor all in one**

What is Dementia?

A vast, expensive crisis — and families are left to face it alone

7.4M

Americans 65+ live with Alzheimer's dementia today

\$409B

projected U.S. dementia care cost in 2026
— toward ~\$1T by 2050

12M+

unpaid family caregivers gave 19.6B hours of care in 2025

2×

as many hospital stays per year vs. older adults without dementia

The real gap isn't awareness — it's guidance after diagnosis.

Two-thirds of Americans want brain-health guidance from a provider, but only 14% have ever discussed it with their doctor.

Behaviors like afternoon agitation are unmet needs trying to be communicated — and they are the #1 driver of caregiver burnout and nursing-home placement. Yet families leave the clinic with a pamphlet, and the apps that exist are static libraries nobody opens.

First-Hand Lived Experiences

Common Themes:

- Need for accessible, easy-to-understand dementia-related guidance
- Desire for a symptom- tracking log to monitor changes over time
 - Engagement through music and personal memories

Literature Review

Researchers examined 35 mobile apps designed to support informal dementia caregivers.

Limited personalization: Only 17% of apps offered tailored support.

Minimal tailoring: Most used only one personalization strategy.

Rare AI support: Only two apps used generative AI assistance.

Quality & Transparency: Most apps stated their goals, but only 20% reported expert review and 11% explained content selection

Information Types: Education was most common (83%), followed by caregiving actions (51%) and referrals (40%).

Available Options

Dementia Support Applications

Dementia Log

AI Advisor and Care Toolset for logging symptoms, mood, and behaviors.

Gap: Only for patients, no caregiver portal, restricted to manual text entry.

Dementia CareAssist

Serves as a research-based handbook for mood alterations and medical preferences.

Gap: Passive text database; lacks active monitoring or immediate crisis features.

My ALZ Journey

Maps local resources and provides generic chapter forums

Gap: Disconnected from day-to-day patient vitals or real-time family updates.

Dementia Dictionary

Decodes patient behaviors into underlying emotional needs.

Gap: Forces stressed caregivers to manually read long text blocks

AlzBuddy

Nostalgic entertainment, hits from 40s-80s, and trivia games.

Gap: Static content with zero real-time personalization or health tracking.

WHAT WE BUILT

Companion Care

Dementia care isn't one person's job

Three people, three needs, one shared source of truth. We present physician first — it's the differentiator that pays.

Physician

A 90-second, glanceable summary of months of home life. Counts and dates — never a diagnosis. The part the doctor never gets to see.

Caregiver

60-second voice logs become a trigger fingerprint that finds patterns, cues what works, and teaches the next skill: problem → training → solution.

Patient

A calm, photo-led, voice-first space. Their music, their people, their memories. Accessible and dignified — built to be used, not just monitored.

Everyone ships a library. We ship an intelligence layer.

TODAY'S DEMENTIA APPS

-  Static libraries of articles & videos — opened once, then abandoned
-  Generic advice, identical for every patient
-  Caregiver-only — the patient and doctor are left out
-  English-only, no cultural fit
-  Disconnected from the actual doctor visit

COMPANION

-  Learns THIS person — a living trigger fingerprint that updates daily
-  Cues the right response at the right moment, not a search box
-  One shared system for patient + caregiver + doctor
-  Bilingual & culturally aware by design
-  One tap turns months of home life into a doctor-ready summary

The line: “Every other app is a library you have to dig through. We're the intelligence layer that does the digging — and learns your specific person while it does it.”

Every feature answers a problem a family actually named

Afternoon agitation

Pattern + music cue at the right moment

Forgetting meds & water

Gentle cues in a familiar caregiver's voice

Caregiver exhaustion

60-second voice logs — no typing, no burden

Safety & wandering

Red-flag alerts + emergency “notify my circle”

Care that changes hands

One-tap handoff carries the full fingerprint

Language & culture

Fully bilingual, culturally aware by design

FUNDING & SUSTAINABILITY STRATEGY

Building Companion Care™ into a Scalable, Sustainable Solution

We are not selling an app. We are delivering measurable outcomes and reducing avoidable costs.
If we don't create value, we don't get paid.

Companion Care™
 Care Together. Better Together.

The intelligence layer dementia care has been missing.

We turn 60-second voice logs into a per-patient trigger fingerprint — learning what sets this specific person off and what calms them — then cue the right response, teach the caregiver, and hand the doctor a 90-second summary. **Built for the patient, the caregiver, and the doctor, at once.**

Pilot partners & clinical sites

Funding to reach 50 families
